project proposals

Hi Kelsey,

I like proposals that are to the point, i.e., brief but providing precise answers to three fundamental questions that you need to address.

Specifically:
1. The problem statement should be rigorously defined, e.g., by specifying the inputs and output.
2. The training/testing sets should be identified. It is important to provide an accurate overview of the main characteristics of the datasets (# examples, # features, type of features, etc).
3. A precise reference (e.g., an article citation) should be given for the method that you will implement. You should also briefly explain why you think the method is appropriate for your problem.

No need to be lengthy. All of the above can be provided in half a page.
